188061**[Links](#)**THROMBOSPONDIN II; THBS2**Alternative titles; symbols*****TSP2**Gene map locus [6q27](#)**TEXT**

Thrombospondin was originally discovered as a secretory product of platelet alpha-granules ([Baenziger et al., 1971](#)). Since that time it has been detected as a product of a great variety of cells. It is a multifunctional protein that contains binding sites for thrombin, fibrinogen, heparin, fibronectin, plasminogen, plasminogen activator, collagen, laminin, etc. It functions in many cell adhesion and migration events, including platelet aggregation. It also influences granule cell migration during histogenesis of the cerebellar cortex. In the developing mouse embryo, it is present as early as the 1-to-4-cell stage. While searching a human fibroblast library for fibrillin (134797) cDNA, [LaBell et al. \(1992\)](#) identified cDNAs with a high degree of homology to human thrombospondin I (THBS1; [188060](#)). The new form of thrombospondin hybridized to a 7.5-kb message by Northern analysis. The gene was transcribed in fibroblasts, smooth muscle cells, and an osteosarcoma cell line, at somewhat lower levels than that of thrombospondin I. Umbilical vein endothelial cells did not transcribe thrombospondin II. Sequence comparison of THBS1 and THBS2 demonstrated that the 2 cysteines involved in interchain disulfide linkage and trimer assembly are conserved in both. Also, Swiss 3T3 fibroblasts express both THBS1 and THBS2. [O'Rourke et al. \(1992\)](#) demonstrated that these cells and epithelial cells transfected with THBS expression vectors express both homotrimeric and heterotrimeric forms of the protein.

[Bornstein et al. \(1991\)](#) demonstrated a second expressed thrombospondin gene, *Thbs2*, in the mouse. Both similarities to and differences from *Thbs1* were demonstrated. In marked contrast to *Thbs1*, the *Thbs2* gene was not induced by serum in NIH 3T3 cells; promoter sequences in the 2 genes were also very different. [Bornstein et al. \(1991\)](#) concluded that the 2 probably perform related but distinct functions.

LaBell et al. (1992) mapped the THBS2 gene to 6q27 by analysis of somatic cell hybrids and by in situ hybridization. Bornstein et al. (1991) found that Thbs2 is located on chromosome 17, band A3, in the mouse.

Kyriakides et al. (1998) disrupted the thrombospondin-2 gene, which they designated TSP2, to generate homozygous tsp2-null mice. Mutant mice were produced with the expected Mendelian frequency and were fertile and overtly normal. However, they displayed a variety of mutant phenotypes, including abnormalities in connective tissue structure and function, upon closer inspection. The skin was fragile and had reduced tensile strength, and the tail was unusually flexible. Mutant mice displayed increased cortical bone thickness and density, a significant increase in density in small blood vessels in skin and other tissues, and had abnormally long bleeding times. Based on this phenotype, Kyriakides et al. (1998) suggested that Thbs2 modulates the cell surface properties of mesenchymal cells, affecting cell functions such as adhesion and migration. 🧠

To examine directly the biologic effect of THBS2 expression on tumor growth and angiogenesis, Streit et al. (1999) stably transfected human squamous cell carcinoma cells that do not express THBS2 with a murine Thbs2 expression vector or with vector alone. Cells expressing THBS2 did not show an altered growth rate, colony-forming ability, or susceptibility to induction of apoptosis in vitro. However, injection of THBS2-transfected clones into the dermis of nude mice resulted in pronounced inhibition of tumor growth that was significantly stronger than the inhibition observed in clones stably transfected with a thrombospondin-1 expression vector, and combined overexpression of Thbs1 and Thbs2 completely prevented tumor formation. Extensive areas of necrosis were observed in Thbs2-expressing tumors, and both the density and the size of tumor vessels were significantly reduced, although tumor cell expression of the major tumor angiogenesis factor, vascular endothelial growth factor (192240), was maintained at high levels. These findings established THBS2 as a potent endogenous inhibitor of tumor growth and angiogenesis. 🧠
